

Monitoring Tools

Here we discuss a few tool Azure offers to monitor your subscription.

Azure Advisor

Azure Advisor is a native, digital consultant that uses telemetry of your resource configuration and usage to provide your personalized recommendations. Its main task is to assign your infrastructure to the Microsoft Azure Well-Architected Framework. By offering onsite guidance, Advisor makes sure that your cloud environment is not only good, but efficient, safe, and resilient.

One of Azure recommendation is to create alters within “Service Health”. It notifies you about Azure service incidents and planned maintenance so you can take action to mitigate downtime.

Note: Service health is looking at Azure services as whole (not particularly our resources).

Azure Monitor

This is a centralized dashboard of all logging and analytics of your account.

In Azure Monitor we have a few ways of viewing the data: Metrics view, logs view, ...

For each resource we can view issues. There are prewritten queries as well.
